DESCRIPTORS: *Birds, Reproduction (Physiology),
*Behavior, Eggs, Stimulation.

In the course of nest-building and egg-laying the thresholds of two innate reactions -- brooding and feeding -- are lowered simultaneously. By the end of egg-laying the bird is equally ready to act according to both reactions. The sequence of these reactions depends on the sequence in which the stimuli are formed. In most of the passerines the nest is three times as strong a (Biological Sciences--Zoology, TT, v. 10, no. 2) (over)
